## RESEARCH INTERESTS

I study fluid PDEs, especially the free-boundary problems of inviscid fluids, such as water waves with vorticity, MHD, elastodynamics, relativistic fluids, liquid crystals, etc.

- Nonlinear stability of compressible vortex sheets in various kinds of fluids with or without surface tension.
- Incompressible limit of free-surface inviscid fluids, including the case of ill-prepared initial data. This is also viewed as the singular limit of hyperbolic systems whose (free) boundaries are characteristic.
- Singularity or long-time evolution of free-surface inviscid fluids.
